

Higher Order Uncertainty and Evidential Ontologies

Justin Brody

October 22, 2009

1 Ontology of Evidence

2 Higher Order Uncertainty

3 Future Work

Ontology of Evidence

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- An *ontology of evidence* was proposed by Laskey, Schum, Costa, and Janssen as a mechanism to allow systems to reason with evidence.

Ontology of Evidence

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- An *ontology of evidence* was proposed by Laskey, Schum, Costa, and Janssen as a mechanism to allow systems to reason with evidence.
- Evidential reasoning has been extensively analyzed, in particular by David Schum. In particular, he identifies the following source-dependent factors as essential:
 - 1 The source credibility (believability)
 - 2 The relevance of the evidence
 - 3 The inferential weight of the evidence

Higher Order
Uncertainty

Future Work

- An *ontology of evidence* was proposed by Laskey, Schum, Costa, and Janssen as a mechanism to allow systems to reason with evidence.
- Evidential reasoning has been extensively analyzed, in particular by David Schum. In particular, he identifies the following source-dependent factors as essential:
 - 1 The source credibility (believability)
 - 2 The relevance of the evidence
 - 3 The inferential weight of the evidence
- Reasoning with evidence is inherently uncertain.

An Example

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- It is very easy to imagine a credible human source asserting:

An Example

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- It is very easy to imagine a credible human source asserting:
 - 1 “bin Laden is somewhere in Afghanistan”

An Example

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- It is very easy to imagine a credible human source asserting:
 - 1 “bin Laden is somewhere in Afghanistan”
 - 2 “the only luxury cars used by al-Qaeda are in Kandahar, Parachinar, or Islamabad”

An Example

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

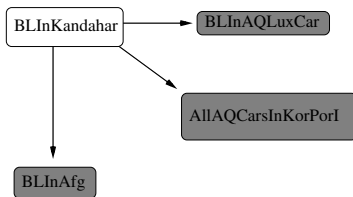

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- It is very easy to imagine a credible human source asserting:
 - 1 “bin Laden is somewhere in Afghanistan”
 - 2 “the only luxury cars used by al-Qaeda are in Kandahar, Parachinar, or Islamabad”
 - 3 “bin Laden was recently seen in an al-Qaeda owned luxury car”

Bayesian Network

- Probability theory provides a rigorously grounded framework for working with uncertainty.

Bayesian Network

- Probability theory provides a rigorously grounded framework for working with uncertainty.
- Bayesian networks provide a practical way with working within a probabilistic context, provide there is a sufficient degree of *conditional independence*

We can get better structural representation by combining Bayesian networks with first-order logic.

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

Credibility

As mentioned previously, we might not have complete confidence in X 's assertion. We can therefore attach credibility level to his assertion and adjust our confidence accordingly.

Higher Order Uncertainty

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- Question: How should an agent's credibility affect our confidence in his or her assertions?

Higher Order Uncertainty

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- Question: How should an agent's credibility affect our confidence in his or her assertions?
- Question: How should varying contextual factors affect the credibility we ascribe to an agent's assertions?

Higher Order Uncertainty

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- Question: How should an agent's credibility affect our confidence in his or her assertions?
- Question: How should varying contextual factors affect the credibility we ascribe to an agent's assertions?
- For example, the credibility ascribed to an assertion made under duress will depend on many factors, including the form of the duress and various contextual factors surrounding the agent.

Higher Order Uncertainty

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- Question: How should an agent's credibility affect our confidence in his or her assertions?
- Question: How should varying contextual factors affect the credibility we ascribe to an agent's assertions?
- For example, the credibility ascribed to an assertion made under duress will depend on many factors, including the form of the duress and various contextual factors surrounding the agent.
- The uncertainty around these kinds of questions is as great as that around the questions of basic relationships between real objects of the world.

Higher Order Uncertainty

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- Question: How should an agent's credibility affect our confidence in his or her assertions?
- Question: How should varying contextual factors affect the credibility we ascribe to an agent's assertions?
- For example, the credibility ascribed to an assertion made under duress will depend on many factors, including the form of the duress and various contextual factors surrounding the agent.
- The uncertainty around these kinds of questions is as great as that around the questions of basic relationships between real objects of the world.
- Because this uncertainty is about network structure rather than objects of the world, we call it *higher order*. Because of the complexity involved, coming to terms with this kind of uncertainty is as amenable to computer-aided analysis as any other.

Higher Order Probability

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- H. Gaifman worked out a formal system of higher probabilities.

Higher Order Probability

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- H. Gaifman worked out a formal system of higher probabilities.
- His scheme introduces an operator $Pr(A, \Delta)$ which means that the “true” probability of A is in the interval Δ .

Higher Order Probability

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- H. Gaifman worked out a formal system of higher probabilities.
- His scheme introduces an operator $Pr(A, \Delta)$ which means that the “true” probability of A is in the interval Δ .
- The thinking is half subjectivist, half objectivist: He wants to be able to make statements like $P(A) = .6$ and $P(Pr(A, [.7, .8])) = .3$ which we can interpret as saying that the agent believes A with confidence .6 but also believes that there’s a 30% chance that the *true* probability is actually between .7 and .8.

Higher Order Probability

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- H. Gaifman worked out a formal system of higher probabilities.
- His scheme introduces an operator $Pr(A, \Delta)$ which means that the “true” probability of A is in the interval Δ .
- The thinking is half subjectivist, half objectivist: He wants to be able to make statements like $P(A) = .6$ and $P(Pr(A, [.7, .8])) = .3$ which we can interpret as saying that the agent believes A with confidence .6 but also believes that there’s a 30% chance that the *true* probability is actually between .7 and .8.
- Gaifman embeds his operator with a system of propositional calculus and shows that nested applications of the $Pr(\cdot)$ operator are eliminable. He views his construction as being analogous to a modal logic.

A New Operator

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- We would like to proceed analogously within MEBN

A New Operator

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- We would like to proceed analogously within MEBN
- Following Neuhaus and Anderson, we propose the addition of a $\text{PropositionalContent}(\cdot)$ operator.

A New Operator

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- We would like to proceed analogously within MEBN
- Following Neuhaus and Anderson, we propose the addition of a `PropositionalContent(·)` operator.
- This will allow the network to encode hypotheses about various assertions, and ultimately learn about higher order uncertainty through evidence.

An Example

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

Consider the following simple rule that gives a partial coding of how we might deal with an agent X making an assertion a while under duress:

- If the assertion is inconsequential, then the credibility is unaltered
- Otherwise, monetary duress combined with a belief by X that he will be paid for his information should result in the credibility of the assertion being decreased by some parameter α
- A consequential assertion made while under physical duress should result in a decrease by the parameter β if X is deemed insufficiently competent to judge a .

Syntax and Semantics

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- We code the rule: “A consequential assertion made while under physical duress should result in a decrease by the parameter β if X is deemed insufficiently competent to judge a .”

$$\begin{aligned} &(\text{Consequential}(a) \geq \chi) \wedge (\text{DuressType}(X) = \text{Physical}) \wedge \\ &(\text{CompetenceToJudge}(X, a) < \theta) \\ &\rightarrow (\Delta(\text{Cred}(a)) = -\beta) \end{aligned}$$

Syntax and Semantics

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

Suppose in this scenario that we learn that agent X has asserted “bin Laden is in Afghanistan” while under physical duress. This might be represented as:

$$\begin{aligned} & \text{Asserts}(X, a) \\ & \wedge \text{PropCont}(a) = " \exists y [\text{In}(BL, y) \wedge \text{PartOf}(y, Afg)] " \\ & \wedge \text{UnderDuress}(X) \wedge \text{DuressType}(X) = \text{Physical} \end{aligned}$$

Syntax and Semantics

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

Suppose in this scenario that we learn that agent X has asserted “bin Laden is in Afghanistan” while under physical duress. This might be represented as:

$$\begin{aligned} & \text{Asserts}(X, a) \\ & \wedge \text{PropCont}(a) = \text{"}\exists y [\text{In}(BL, y) \wedge \text{PartOf}(y, Afg)]\text{"} \\ & \wedge \text{UnderDuress}(X) \wedge \text{DuressType}(X) = \text{Physical} \end{aligned}$$

The semantics should be defined so that the credibility of the corresponding assertion is decreased, and the whatever rules we have for applying credibility to assertions would be applied.

Future Work

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- Generally work out the details of a possible modification to MEBN.

Future Work

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- Generally work out the details of a possible modification to MEBN.
- What computational cost would come with deductions in the new system?

Future Work

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- Generally work out the details of a possible modification to MEBN.
- What computational cost would come with deductions in the new system?
- What quantifier complexity is necessary?

Future Work

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- Generally work out the details of a possible modification to MEBN.
- What computational cost would come with deductions in the new system?
- What quantifier complexity is necessary?
- Proof theory for added operator

Future Work

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- Generally work out the details of a possible modification to MEBN.
- What computational cost would come with deductions in the new system?
- What quantifier complexity is necessary?
- Proof theory for added operator
- Can we guarantee logical *and* probabilistic consistency (e.g. avoid “Dutch booking”)

Future Work

Higher Order
Uncertainty
and Evidential
Ontologies

Justin Brody

Ontology of
Evidence

Higher Order
Uncertainty

Future Work

- Generally work out the details of a possible modification to MEBN.
- What computational cost would come with deductions in the new system?
- What quantifier complexity is necessary?
- Proof theory for added operator
- Can we guarantee logical *and* probabilistic consistency (e.g. avoid “Dutch booking”)
- Do a more general cost/benefit analysis.
