

# An ontological approach to information access control and provenance

Bill Andersen    Fabian Neuhaus

October 22, 2009

What can the IC learn from the success of ontologies in  
the biomedical domain?

... not much

One reason:

biological ontologies deal with **open** and **epistemically  
stable** information

What can the IC learn from the success of ontologies in  
the biomedical domain?

... not much

One reason:

biological ontologies deal with **open** and **epistemically  
stable** information

What can the IC learn from the success of ontologies in  
the biomedical domain?

... not much

One reason:

biological ontologies deal with **open** and **epistemically  
stable** information

## The Information Dilemma

Responsibility to share information (ICD 501)

vs.

Responsibility to protect information  
(incl. methods & sources)

Need for access control

# IC Information is not Epistemically Stable

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

- ▶ information provided by unreliable sources
- ▶ logically inconsistent information

- ▶ Biologists: What is the case?
- ▶ IC: Who said what?

Need for provenance tracking

# Regards from Bill

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

Ontology language that supports

- ▶ multi-level access control
- ▶ provenance tracking
- ▶ reasoning with logically inconsistent information

Features for access control and provenance tracking are fully integrated in the language, not a separate meta-level layer.

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Challenge 1:  
Reasoning  
with geospa-  
tial informa-  
tion

Introduction

Example

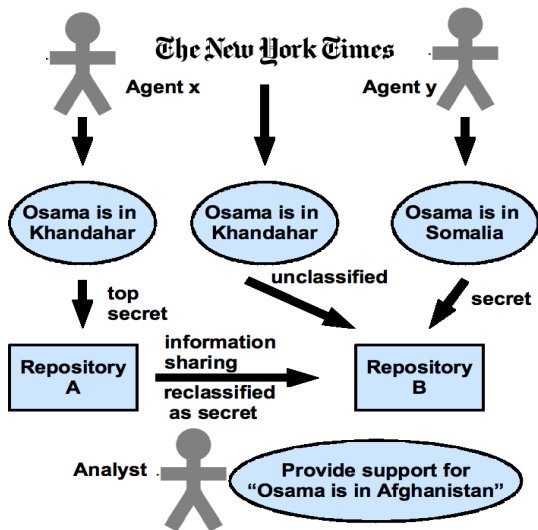

Ontological  
considerations

Formalization

# Running Example

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

**Challenge 2:**  
Reasoning  
with  
inconsistent  
information

Introduction

Example

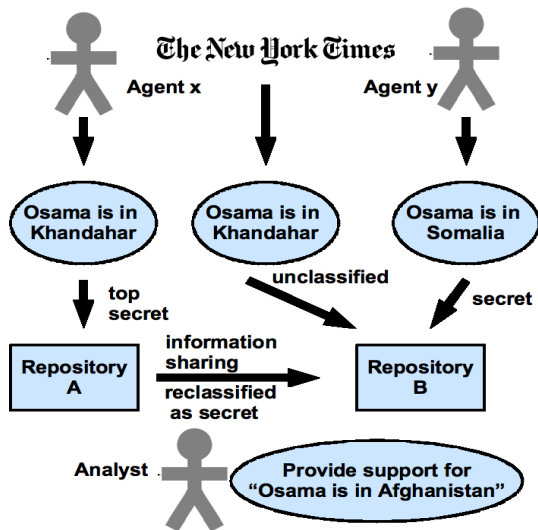

Ontological  
considerations

Formalization

# Running Example

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Challenge 3:  
Security  
classification  
of analyst  
impacts  
query

Introduction

Example

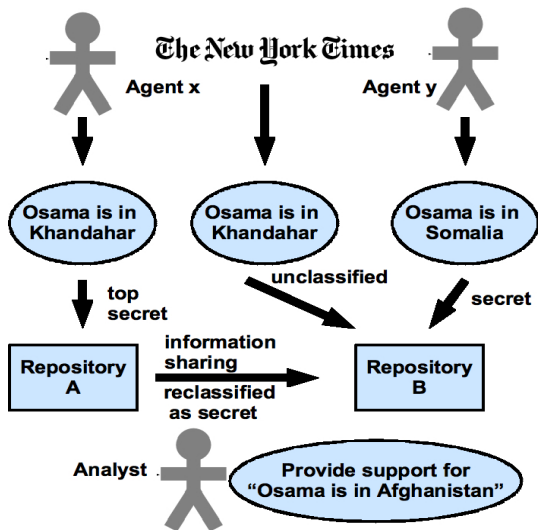

Ontological  
considerations

Formalization

# Running Example

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Challenge 4:  
One record  
in B is a  
'copy' of the  
record in A

Introduction

Example

Ontological  
considerations

Formalization

## Introduction

## Example

## Ontological considerations

## Formalization

Introduction

Example

Ontological  
considerations

Formalization

Information is abstract

- ▶ no spatio-temporal location
- ▶ no causal powers
- ▶ other examples: the natural numbers, geometric shapes, moral values

It is impossible to control access to information!

Objects of access control are physical entities that encode information; e.g. paper documents, arrangements of electrons in a chip etc.

It is impossible to control access to information!

Objects of access control are physical entities that encode information; e.g. paper documents, arrangements of electrons in a chip etc.

# Proposition, Sentence Type, Sentence Token

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

*proposition*: a unit of information that is true or false

*sentence type*: a well-formed expression of a language  
that can be asserted by speakers to express a proposition

*sentence token*: a physical entity (or an arrangement of  
physical entities) that instantiates a sentence type

# Example: How many sentences do you count?

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

The cat is on the mat.

Die Katze ist auf der Matte.

The cat is on the mat.

Sentence tokens are the primary bearers of security  
properties and access control!

# Running Example

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

# What you can do with tokens ...

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

- ▶ Copying
- ▶ Recoding (e.g., English to German, JPG to PDF)
- ▶ "Write down" (e.g., blackening sentences)
- ▶ Syntheses (e.g., summary, **automatic reasoning**)

Provenance: causal history of tokens

Access control:

- ▶ set of security classifications of tokens  
(levels, compartments)
- ▶ security classification impact the processing of tokens
- ▶ inheritance of security classifications along causal  
history

Osama is in Khandahar <top secret>

IF somebody is in Khandahar THEN he is in Afghanistan

New token:

Osama is in Afghanistan <???

Osama is in Khandahar <top secret>

IF somebody is in Khandahar THEN he is in Afghanistan

New token:

Osama is in Afghanistan <???

## Introduction

## Example

## Ontological considerations

## Formalization

+++DISCLAIMER+++

- ▶ Only basic ideas (more details in the paper)
- ▶ Theoretical perspective (for implementation ask Bill)

# Something was missing

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

Introduction

Example

Ontological  
considerations

Formalization

# Tokens and 'meta-data' are treated as first-class entities by the prover

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

Information about record in repository A:

```
Record(token001) &  
ResidesIn(token001) = repository_A &  
PropositionalContent(token001) =  
    (that (LocatedIn (osama kandahar)))) &  
ClassifiedAs (token001 top_secret) &  
Compartment (token001 al-quaeda_cmpt) &  
Source(token001) = agent_x
```

# Provenance info is treated in the same way

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

Information about record in repository B:

Record(token002) &  
ResidesIn(token002) = repository\_B &  
PropositionalContent(token002) =  
    (that (LocatedIn (osama kandahar))) &  
ClassifiedAs(token002 secret) &  
CopyOf(token002, token001) &  
ResidesIn(token001) = repository\_A

# SupportedBy: relation between a proposition and a sequence of tokens

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

**A[s]** shorthand for  $\text{SupportedBy}(\text{that } A, s)$

Axioms:

- ▶  $\text{Record}(x) \rightarrow \text{SupportedBy}(\text{PropositionalContent}(x), x)$
- ▶  $A \rightarrow A[ ]$
- ▶  $(A[s_1] \& B[s_2] \& \Diamond(A \& B)) \rightarrow (A \& B)[s_1, s_2]$
- ▶  $(A[s] \& \Diamond A \& \Box(A \rightarrow B)) \rightarrow B[s]$

SupportedBy behaves like a paraconsistent strict implication

- ▶ `LocatedIn (osama kandahar)[token001]`
- ▶ `LocatedIn(x kandahar)→LocatedIn(x afghanistan)[ ]`
- ▶ `LocatedIn (osama afghanistan)[token001]`

# ClearedFor: a relation between users and classifications

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

```
name(analyst001) = 'Nathan Hale'  
ClearedFor(analyst001 top_secret)  
ClearedFor(analyst001 asia_cmpt)  
ClearedFor(analyst001 terrorism_cmpt)
```

# Analyst's question

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

Nathan Hale: Is Osama in Afghanistan?

# The system turns it into this query

An ontological approach  
to information access  
control and provenance

Bill Andersen, Fabian  
Neuhaus

Introduction

Example

Ontological  
considerations

Formalization

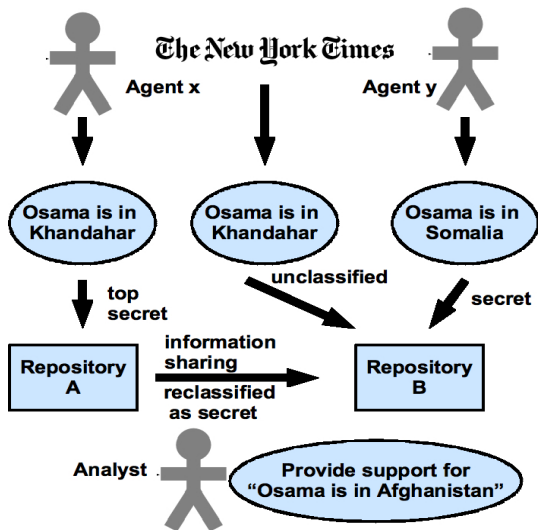

Find a sequence of tokens  $s$  such that

- ▶  $s$  supports that Osama is in Afghanistan
- ▶ NH is cleared for security levels and compartments of elements of  $s$
- ▶  $s$  does not contain an element that is a copy of another token that
  - ▶ NH has clearance for, and
  - ▶ resides in an accessible repository

# Revisiting the Challenges

An ontological approach  
to information access  
control and provenance
