

# Implementing Uncertainty in a Logic Programming Framework

**Trevor Martin,**

*AI Group, University of Bristol, UK*

*(Senior Research Fellow, BT Intelligent Systems Lab)*

Trevor.Martin@bristol.ac.uk

# How should we handle uncertainty?

- mathematician : probability
  - model (subjective) uncertainty by gambling
  - anyone who does not follow the laws of probability is guaranteed to make a loss (Dutch book)

3 out of 4 boxes contain an apple

## Option 1

Play as many times as you like.  
The (opaque) boxes are shuffled.  
You pay £1 and choose a box.  
If the box contains an apple, you win £1-50

## Option 2

Same but if the box contains an apple, you win £1-05

# Problems with Propositions

how many of these boxes contain a bunch of grapes ?

- sorites paradox : take one grain from a heap of sand and you still have a heap of sand. One grain is not a heap; adding another grain is still not a heap
- similarly - what is meant by
  - checkout time is 11:00
  - speed limit is 30mph

In between the black and white cases, there are shades of grey

# Natural Language

- words mean what we agree that they mean
  - *wicked, cool, bling, chav, rubbish*
  - light snowfall, bright colour, rock music
  - what makes a White Christmas? “*That one flake of snow will fall on Met office monitoring stations over the 24 hr period of the 25th of December*”  
[www.mybetting.co.uk/white-christmas-betting.htm](http://www.mybetting.co.uk/white-christmas-betting.htm)
- communication is made more efficient by use of loose definitions
- over-precision is not user-friendly
  - should we **adapt our thinking** to the computer *or*
  - **adapt the computer** to us

# Fuzzy Sets

( fuzzy ABS )

*drizzle = “uniform precipitation composed exclusively of fine drops with diameters of less than 0.02 inch (0.5 mm) very close together”*

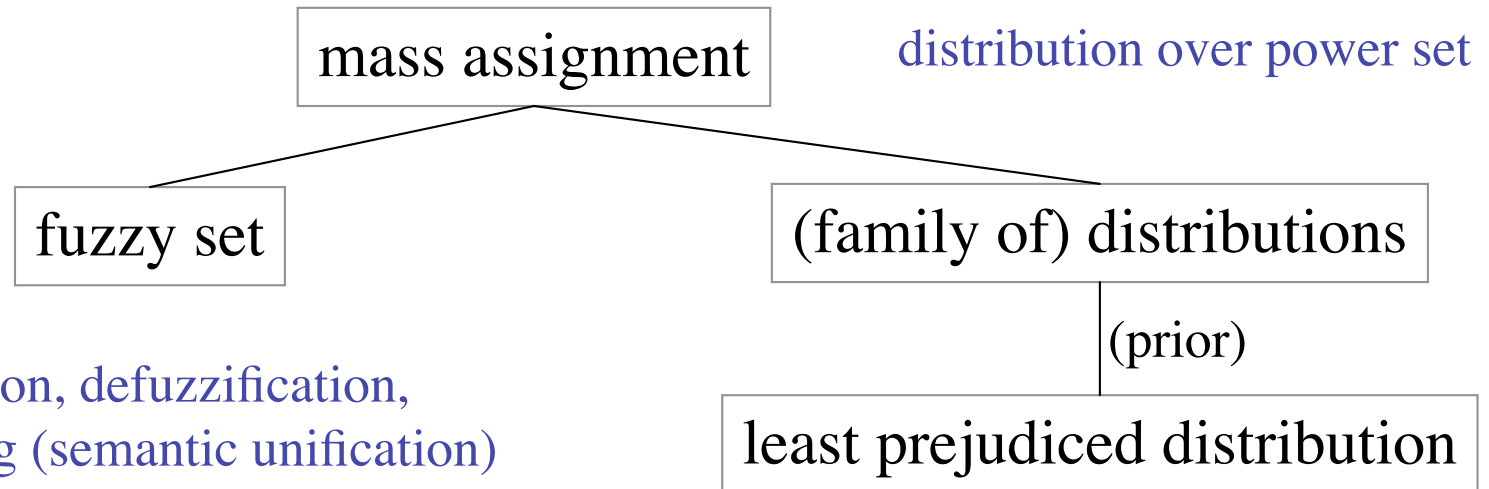

*a few minutes = 2-10 minutes  
( [www.daml.org](http://www.daml.org) )*

- in mathematics we have precisely defined terms
  - a set has a characteristic function  $\chi : U \rightarrow \{0, 1\}$
- in human language, most terms are defined by use
  - a **fuzzy set** has a characteristic function  $\chi : U \rightarrow [0, 1]$
  - it indicates the **degree** to which an object has some property
  - more generally  $\chi : U \rightarrow L$  where L is a lattice
  - X is fuzzy if an object can be *very X, slightly X, etc*
  - fuzzy can be related to probability via random sets / mass assignment

$U = \{1, 2, 3, 4, 5, 6\}$

X	$\chi_{\text{even}}(x)$	$\chi_{\text{small}}(x)$
1	0	1
2	1	0.7
3	0	0.3
4	1	0
5	0	0
6	1	0

# Mass Assignments

enables deduction, defuzzification,  
partial matching (semantic unification)  
e.g.  $\Pr(x \text{ is } \textit{small} \mid x \text{ is } \textit{medium})$

(cf random sets, basic probability assignment)

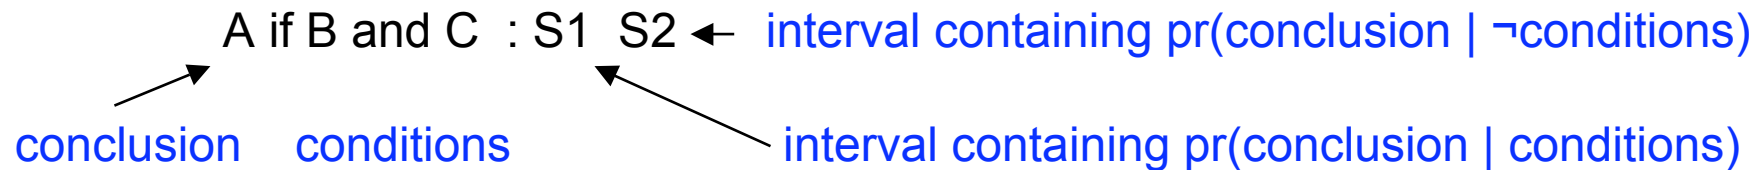

- voting model : interpret fuzzy set membership as *the proportion of voters (possible worlds) who agree that a value satisfies a fuzzy label*
  - $\textit{small} = \{1/1, 2/0.7, 3/0.3\}$
  - 30% accept  $\{1, 2, 3\}$  as *small*, 40% accept  $\{1, 2\}$ , 30% accept  $\{1\}$
  - least prejudiced distribution 1 : 0.6, 2 : 0.3, 3 : 0.1
- MA references : Google ← baldwin AND “mass assignment”

# Uncertain Logic Programming

- Many approaches - typically using *numerical* uncertainty
  - implemented systems e.g. Fril, fuzzy Prolog, Fprolog, f-Prolog, Prolog-ELF, ...
  - theoretical studies e.g. van Emden, Kifer & Subrahmanian, Vojtas, Lukasiewicz, Damasio & Pereira
- Support logic uses numerical uncertainty - voting model
  - luxuryCar(rolls-royce)                      everyone agrees
  - luxuryCar(jaguar) : 0.9                      9 out of 10 agree
  - likes(John, Jill) : (0.7 0.8)                7/10 yes, 1/10 abstain, 2/10 no
  - highMaintenanceCost(X) :- luxuryCar(X), oldCar(X) : 0.9
  - highMaintenanceCost(X) :- exRentalCar(X), highMileage(X) : (0.8 1)
- what about deduction ?

# Support Logic rules

- Probabilistically quantified rules

((performance of company X is good in YEAR)  
 (turnover of company X in YEAR is *HighTurnover*)  
 (profit of company X in YEAR is *TenToTwentyPC*)) : ( (0.8 1) (0 1))

A if B and C : S1

A if B and  $\neg C$  : S2

**General (extended) rule**

A if  $\neg B$  and C : S3

A if  $\neg B$  and  $\neg C$  : S4

evidential logic uses weighted combination of features

consider basic rule (top)

default conjunction is (interval) product

**(calculation of supports is more complex for general rule)**

# Basic Fril rule - examples

$((\text{blond } X) (\text{swede } X)) : (0.9 \ 0.9)$   
 $((\text{fairSkinned } X) (\text{blond } X)) : (0.8 \ 0.95)$   
 $((\text{swede Bjorn}))$   

---

 $((\text{fairSkinned Bjorn})) : (0.72, 0.955)$

There are between 80% and 95% of blond people who are fair

$\text{Pr}(\text{blond Bjorn}) = 0.9$

$\text{Pr}(\text{fairSkinned Bjorn}) = 0.9x$  where  $x \in [0.8, 0.95]$

$((\text{blond } X) (\text{swede } X)) : (0.9 \ 0.9)$   
 $((\text{fairSkinned } X) (\text{blond } X)) : ((0.8 \ 0.95) (0 \ 0.3))$   
 $((\text{swede Bjorn})) : (0.9 \ 1)$   

---

 $((\text{fairSkinned Bjorn})) : (0.648 \ 0.8915)$

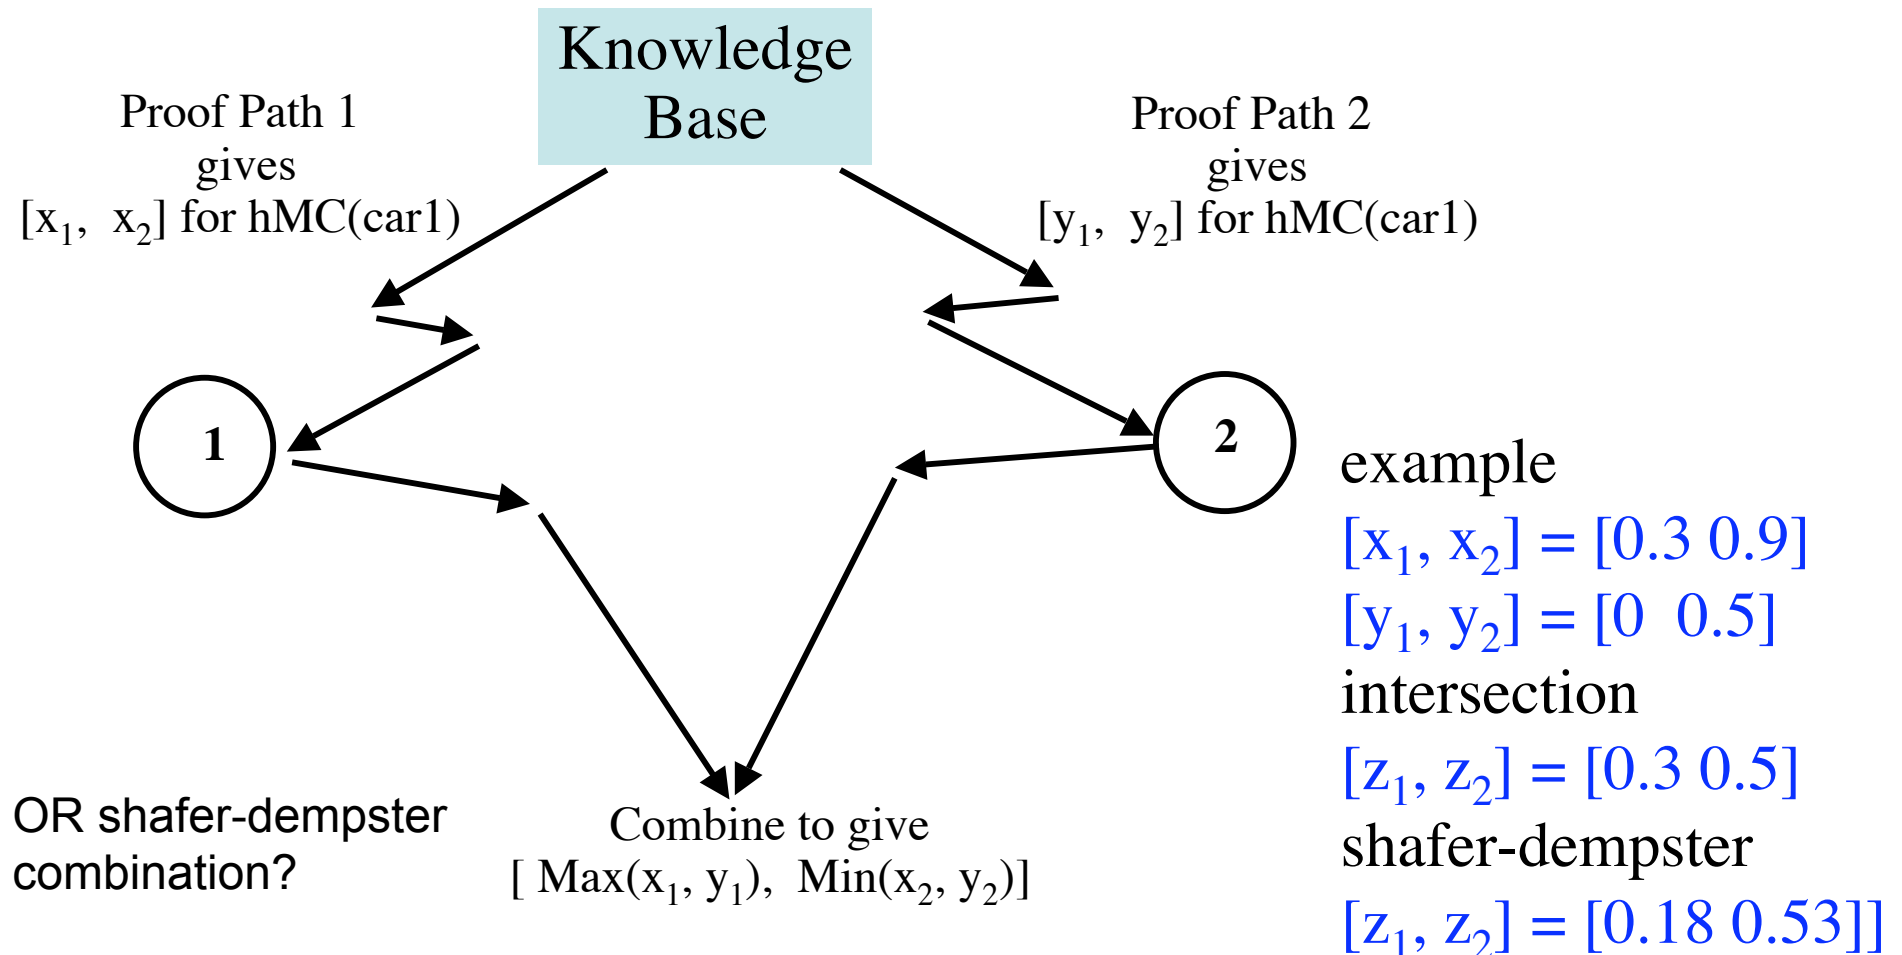

our belief that Bjorn is a Swede

Standard logic program with support calculated on proof path

# Multiple proof paths

highMaintenanceCost(X) :- luxuryCar(X), oldCar(X) : 0.9

highMaintenanceCost(X) :- exRentalCar(X), highMileage(X) : (0.8 1)

# Execution of logic programs

logic program = and/or tree

$p(A,B)$  if  $q(A), r(B)$   
 $p(1, C)$  if  $s(2, C), t(C)$   
 $q(1)$   
 $q(2)$   
 $q(Z)$  if  $t(Z)$  ...

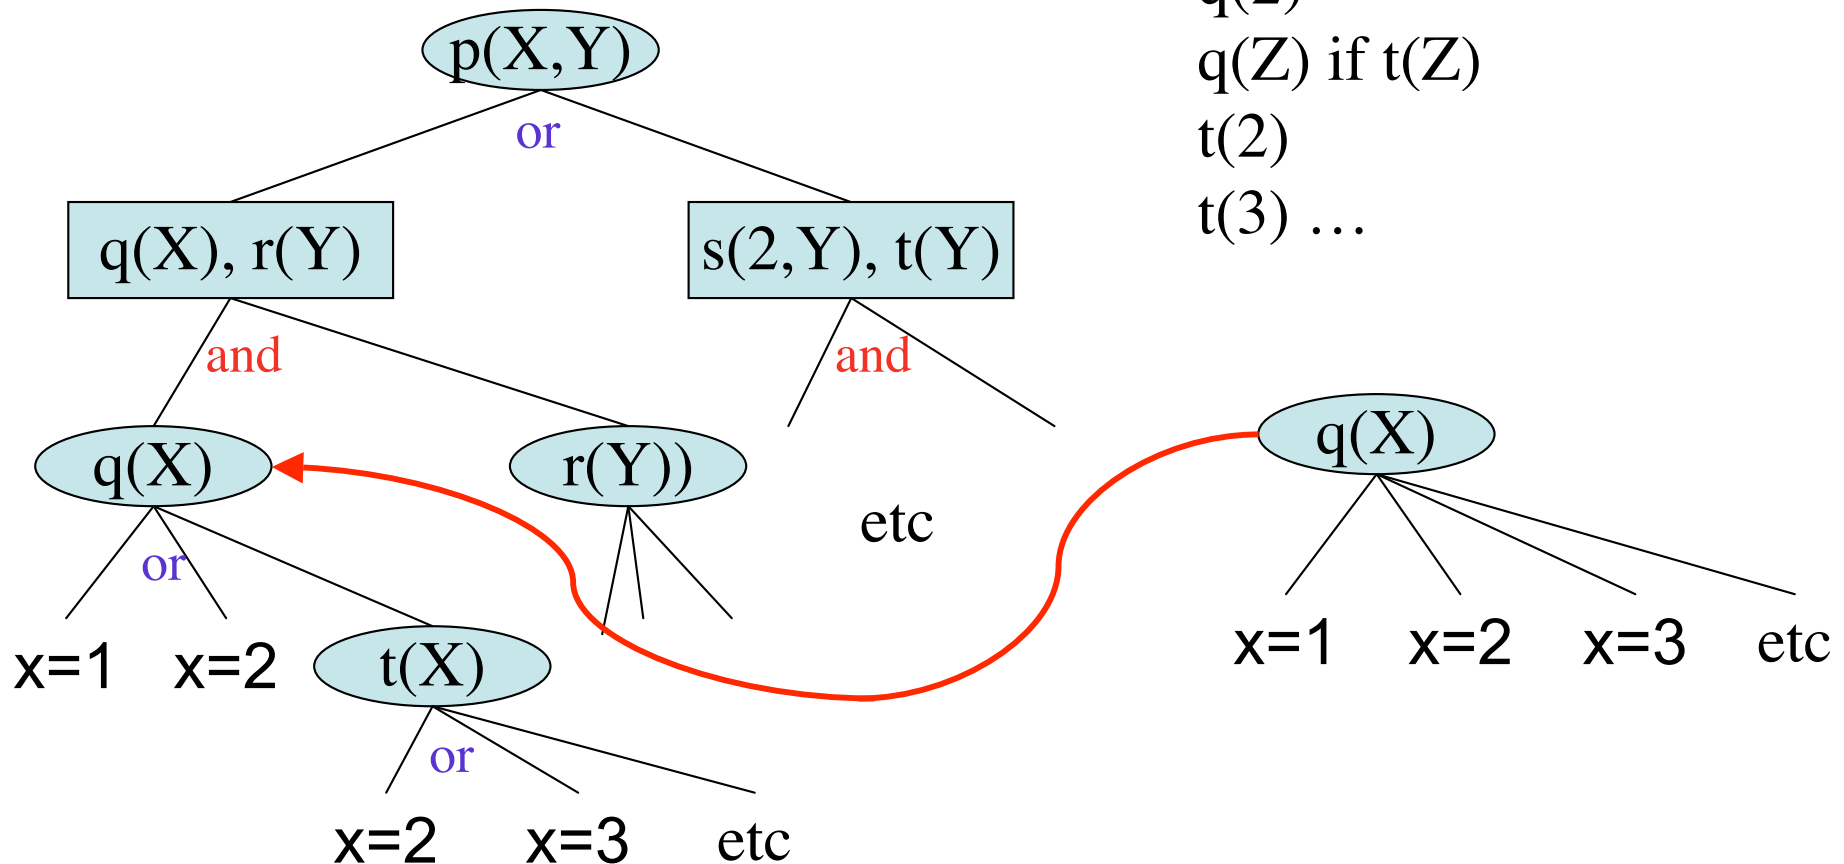

support logic program  
= logic program  
+ calculation of support

breadth search  
- all solutions at *or* nodes

# Support : replace each *or*-node

logic program = and/or tree

$p(A, B)$  if  $q(A), r(B)$   
 $p(1, C)$  if  $s(2, C), t(C)$   
 $q(1)$   
 $q(2)$   
 $q(Z)$  if  $t(Z)$   
 $t(2)$   
 $t(3) \dots$

# Fril Abstract Machine Code

p1:

*set\_mode inter*

*try\_me\_else fail*

*allocate 2*

*push\_support ((.9 1)(0 .1)) <cond>*

*call q, 1, 2*

*put\_var A1, Y2*

*deallocate*

*execute r, 1*

$((p\ A\ B)(q\ A)(r\ B)) : ((.9\ 1)(0\ .1))$

creates choicepoint, support frame

saves environment, continuation

fills support frame

puts variable 2 (B) in reg 1

reset continuation, discard env

q1:

*set\_mode inter*

*try\_me\_else q2*

*get\_const A1, a*

*push\_support (.85 1) <conj>*

*proceed*

$((q\ a)) : (.85\ 1)$

create choicepoint, support frame

unify a with argument 1

fills support frame

evaluate support stack

q2 :

*trust\_me\_else fail*

*push\_support ((.6 .9)(.3 .5)) <cond>*

*execute s*

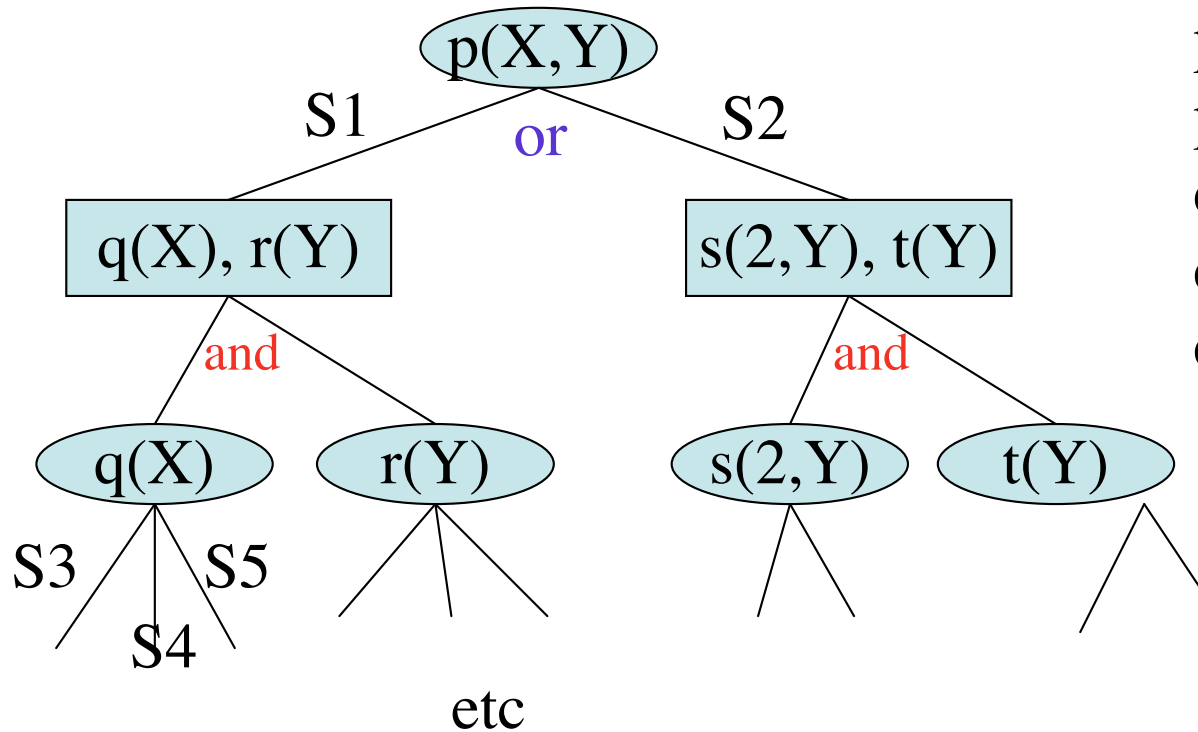

$((q\ Z)(s\ Z)) : ((.6\ .9)(.3\ .5))$

warren machine (Prolog) extended by support ops

# Support operations

- *conj* - overall support for rule body (conjunction) from individual goals (product)  
 $\text{supp}(q(A), r(B)) = \textit{conj}(\text{supp}(q(A)), \text{supp}(r(B)))$
- *cond* - support for rule head from rule body and rule (conditional) support  
 $\text{supp}(\text{head}) = \textit{cond}(\text{supp}(\text{rule}), \text{supp}(\text{body}))$
- *comb* - support for conclusion from multiple paths (intersection)  
 $\text{supp}(\text{conc}) = \textit{comb}(\text{supp}(\text{path1}), \text{supp}(\text{path2}))$

# Calculation of support

$p(A,B) \text{ if } q(A), r(B) : S1$   
 $p(1, C) \text{ if } s(2, C), t(C) : S2$   
 $q(1) : S3$   
 $q(2) : S4$   
 $q(Z) \text{ if } t(Z) : S5 \dots$

$$\text{supp}( p(1, 2) ) = \text{comb} ( \text{cond}(S1, \text{conj} (\text{supp}(q(1)), \text{supp}(r(2)) ) , \text{cond}(S2, \text{conj} (\text{supp}(s(2, 2)), \text{supp}(t(2)) ) ) ) )$$

$$\text{supp}( q(1) ) = \text{comb} ( S3, \text{cond}(S5, \text{conj} (\text{supp}(t(1)) ) ) )$$

# Execution of support logic programs

logic program = and/or tree

$p(A, B) \text{ if } q(A), r(B) : S1$   
 $p(1, C) \text{ if } s(2, C), t(C) : S2$   
 $q(1) : S3$   
 $q(2) : S4$   
 $q(Z) \text{ if } t(Z) : S5 \dots$

support logic program  
= logic program  
+ calculation of support

exhaustive depth search  
(+ support calculation)

# Transformation of SLP $\Rightarrow$ LP

$p(A,B) \text{ if } q(A), r(B) : S1$   
 $p(1, C) \text{ if } s(2, C), t(C) : S2$   
 $q(1) : S3$   
 $q(2) : S4$   
 $q(Z) \text{ if } t(Z) : S5 \dots$

$p(\text{cond}(S1, \text{conj}(S_q, S_r)), A, B) \text{ if } q(S_q, A), r(S_r, B)$   
 $p(\text{cond}(\dots), 1, C) \text{ if } s(Ss, 2, C), t(St, C)$   
 $q(S3, 1)$   
 $q(S4, 2)$   
 $q(\text{cond}(\dots), Z) \text{ if } t(Z)$   
 $\dots$

replace

$$Supp(head) = \text{cond} \left( S_r, \text{conj}_{i=1 \dots n} \left( \text{comb}_{j=1 \dots ki} (S_i^j) \right) \right)$$

with

$$Supp(head) = \text{comb} \left( \text{cond} \left( S_r, \text{conj}_{i=1 \dots n} (S_i^j) \right) \right)$$

because (e.g)

$$\text{conj}(\text{comb}(S_1, S_2), S_3)$$

$$= \text{comb}(\text{conj}(S_1, S_3), \text{conj}(S_2, S_3))$$

Is it a real problem?

two examples

# Cooking without butter - dairy-free spread

Bakery

Beers, Wines, Spirits

Beverages, Hot Drinks

Breakfast Cereals

Clothing

Confectionery, Biscuits,

Cakes

**Cooking/Baking Ingredients**

Crisps, Nuts, Snacks

**Dairy**

Delicatessen

Easter Confectionery

...

Pickles, Preserves, Oils, Spreads

Artificial Sweeteners

Colouring and Decoration

Custard and Cornflour

Dried Fruit

Flour - Other

...

Cheese - American

Cheese - Canadian

...

Cheese - Snacking

...

**Spreads (Butter, Margarine, etc.)**

...

Yogurt - Twin Pots

... **No luck ...**

Cadbury's Mini Eggs Nest, 190  
Lard 250g

Dairy Free Spread 500g

*dairy-free*  
classified  
as *dairy*.  
Not logic!  
But it  
works.

[www.sainsburystoyou.com](http://www.sainsburystoyou.com)

# Wine example - conflicting definitions

wine

- *wine* is a subclass of *potable liquid*
- *wine* -> (madeFromGrape) -> *wineGrape* (at least one)
- *vintage wine* is made from *wineGrapes* harvested in a *single year*

```
<owl:Class rdf:ID="Wine">
  <rdfs:subClassOf rdf:resource =
    "&food;PotableLiquid"/>
  <rdfs:label xml:lang="en">wine</rdfs:label>
  <rdfs:label xml:lang="fr">vin</rdfs:label>
  ... ..
</owl:Class>
```

- *US regulations* : a *vintage wine* is *wine* made from *wineGrapes* at least 95 % of which were harvested in a *single year*

Single ontologies *may* be crisp.

Combined (multiple) ontologies are very unlikely to be crisp

# Modelling with support logic

- first case can be expressed *within* existing frameworks  
 $combinedOnt:vintageWine(X) \leftarrow Fr:vintageWine(X)$ 
  - a straightforward logic programming rule
- what about  
 $Pr(combinedOnt : vintageWine \mid US: vintageWine) \in [0.9, 1]$   
 $combinedOnt : vintageWine(X) \leftarrow US: vintageWine(X) : (0.9 \ 1)$   
(support logic program)
  - not expressible in RuleML / SWRL / logic program

# Fuzzy attribute values

- Support logic also allows uncertainty in attribute values

`height(John, tall)`

`height(Bill, 72)`

`maintenanceCost(X, high) :- luxuryCar(X), age(X, old)`

- interpretation - single value, but not known precisely

- e.g. contrast

- safe-speed on an open highway is *about-80mph*

- current-speed of car-1 is *about-80mph*

`safe-speed(open-highway, 60) : 0.1`

`safe-speed(open-highway, 80) : 1`

...

`safe-speed(open-highway, 90) : 0.2`

`current-speed(car-1, {60/0.1 ... 80/1 ... 90/0.2})`

- how do we unify a query with a clause head

`height(X, medium)`

`height(John, tall)`

`height(X, medium) IF height(X, tall) : Pr(medium | tall)`

# Semantic Unification

e.g. Dice values

- $small = \{1/1, 2/0.7, 3/0.3\}$
- mass assignment is  $\{1, 2, 3\} : 0.3, \{1, 2\} : 0.4, \{1\} : 0.3$
- $about2 = \{1/0.4, 2/1, 3/0.4\}$ , MA =  $\{1\} : 0.6, \{1, 2, 3\} : 0.4$
- $Pr(about2 | small) \in [0.4, 0.82]$
- point value can be calculated if a prior is known

Same method for crisp value given fuzzy set and vice-versa

This requires modifications to the logic programming unification method, and so is not easily embedded in a conventional framework

<b>about2</b>   <b>small</b>	<b>{2} : 0.6</b>	<b>{1, 2, 3} : 0.4</b>						
<b>{1} : 0.3</b>	<table style="width: 100%; text-align: center;"> <tr> <td style="padding: 5px;">F</td> <td style="padding: 5px;">T</td> </tr> <tr> <td style="padding: 5px;"><math>0.3 \times 0.6</math></td> <td style="padding: 5px;"><math>0.3 \times 0.4</math></td> </tr> </table>	F	T	$0.3 \times 0.6$	$0.3 \times 0.4$	<table style="width: 100%; text-align: center;"> <tr> <td style="padding: 5px;">T</td> </tr> <tr> <td style="padding: 5px;"><math>0.3 \times 0.4</math></td> </tr> </table>	T	$0.3 \times 0.4$
F	T							
$0.3 \times 0.6$	$0.3 \times 0.4$							
T								
$0.3 \times 0.4$								
<b>{1, 2} : 0.4</b>	<table style="width: 100%; text-align: center;"> <tr> <td style="padding: 5px;">U</td> <td style="padding: 5px;">T</td> </tr> <tr> <td style="padding: 5px;"><math>0.4 \times 0.6</math></td> <td style="padding: 5px;"><math>0.4 \times 0.4</math></td> </tr> </table>	U	T	$0.4 \times 0.6$	$0.4 \times 0.4$	<table style="width: 100%; text-align: center;"> <tr> <td style="padding: 5px;">T</td> </tr> <tr> <td style="padding: 5px;"><math>0.4 \times 0.4</math></td> </tr> </table>	T	$0.4 \times 0.4$
U	T							
$0.4 \times 0.6$	$0.4 \times 0.4$							
T								
$0.4 \times 0.4$								
<b>{1, 2, 3} : 0.3</b>	<table style="width: 100%; text-align: center;"> <tr> <td style="padding: 5px;">U</td> <td style="padding: 5px;">T</td> </tr> <tr> <td style="padding: 5px;"><math>0.3 \times 0.6</math></td> <td style="padding: 5px;"><math>0.3 \times 0.4</math></td> </tr> </table>	U	T	$0.3 \times 0.6$	$0.3 \times 0.4$	<table style="width: 100%; text-align: center;"> <tr> <td style="padding: 5px;">T</td> </tr> <tr> <td style="padding: 5px;"><math>0.3 \times 0.4</math></td> </tr> </table>	T	$0.3 \times 0.4$
U	T							
$0.3 \times 0.6$	$0.3 \times 0.4$							
T								
$0.3 \times 0.4$								

# Summary - transformed support logic

- restricted form of rules and operators
  - represent *attribute uncertainty* via *predicates*
- embed support as *argument* to predicates
- standard execution model (efficiency)
  - evaluate support when query is completed
- no conflict with “crisp” standards
- no conflict with logic program semantics
  - but rule/fact uncertainty is now implicit, not explicit
  - object level vs meta-level

# Summary - the need for fuzziness

- Machine-based solutions must be **understandable**
  - humans use natural language - machines **cannot understand** NL but **can process** it
  - engineering approach - be consistent with (fuzzy) humans
  - soft methods are vital because most relations / categories / attributes / ... are not defined by unbreakable rules, data can be missing, inconsistent, unreliable, ...
- a useful semantic web needs to be fuzzy
  - meta-data comes from  
humans (subjective) or  
machines (cannot guarantee correctness)
- we expect multiple sources to be (slightly) inconsistent
  - logic says anything follows from inconsistency
  - most rules are not true all the time
  - humans manage, so should machines

# Thank you for your attention
